

IBM

Figma Console MCP Lab Guide

Quick Reference Guide

Division: IBM Client Engineering **Solution:** Healthcare Bob Demo **Version:** 1.0

Date: March 2026

1. Overview

This guide demonstrates how to use IBM Bob with Figma Console MCP to design and build a complete pill tracker application with a Drupal backend and web frontend.

2. Prerequisites

Required Tools

TOOL	DESCRIPTION	SETUP INSTRUCTIONS
Figma Console MCP Server	MCP server for Figma integration	Follow the complete setup guide at Figma Console MCP Documentation
Desktop Bridge Plugin	WebSocket connection plugin	Right-click in Figma → Plugins → Development → Figma Desktop Bridge
Figma Desktop Application	Design editor access	Ensure you have access to the desktop app
IBM Bob	AI assistant	MCP settings must be configured within Bob

Verify MCP Connection

```
# Verify Figma Console MCP is available - Bob will use this automatically
```

```
# In Figma Desktop:  
# 1. Open your design file  
# 2. Right-click → Plugins → Development → Figma Desktop Bridge  
# 3. Plugin should show "Connected" status
```

3. Implementation Steps

STEP 1

Verify Figma Connection

Objective: Check that your Figma connection is active and ready.

PROMPT

```
Check Figma status
```

✓ Expected Result: Connection status confirmation

STEP 2

Review the Specification

Objective: Review the provided specification file before implementation.

File: `pillspec.md` — Complete application specification

PROMPT

```
Implement @pillspec.md into the Figma design file and create the design. All  
components and sections should live within one design and be vertically  
stacked and be for desktop view.
```

Example Result:

Figure 1: Initial Figma design generation

STEP 3

Edit Figma Design

Objective: Make manual adjustments to the design directly in the Figma Desktop application as needed.

Actions

1. Open the generated design in Figma Desktop
2. Review all components and sections
3. Make necessary adjustments to layout, spacing, and styling
4. Ensure design consistency across all elements

Example Result:

Figure 2: Updated Figma design after manual edits

STEP 4

Build Application with Drupal Backend

Objective: Generate the application code based on the updated Figma design.

PROMPT

I have made changes to the figma design. With these changes, build a pill tracker application following @pillspec.md and the new design. Use a drupal stack for the backend with mysql database & a web front end.

Expected Output

- Drupal backend module

- MySQL database schema
- Web frontend application
- Integration between frontend and backend

STEP 5

Validate the Stack

Objective: Verify that the generated application is functioning correctly.

PROMPT

Validate the Drupal stack health and functionality

Validation Checklist

- ☐ Database connection successful
- ☐ Backend API endpoints responding
- ☐ Frontend loading correctly
- ☐ Data flow between frontend and backend working

4. Resources

Key Files

FILE	DESCRIPTION
pillspec.md	Application specification
database/schema.sql	Database schema
backend/pill_tracker/	Drupal module
frontend/	Web application
DEPLOYMENT.md	Deployment guide
VALIDATION_REPORT.md	Validation results
